

Business Process Management Maturity Assessment Tool

Your Score is 38 .

Your responses to the survey indicate that you are: **Level 4 - Optimize**

Find out what your score means below.

Score 10-15	LEVEL 1 - INITIATE	This level is characterized by ad hoc or chaotic processes. Success often depends upon the competence or heroics of the employees in the organization rather than on the use of proven processes. At this level, products and services work, but getting them produced often exceeds both the budget and schedule. Often these organizations over commit, abandon processes, or cannot repeat past successes.
Score 16-25	LEVEL 2 - DEVELOP	At this level, projects are planned, performed, measured, and controlled. Standards, process descriptions, and procedures may be different, yet the established process management discipline helps to ensure that existing practices are retained, and that projects are performed and managed according to documented plans. Requirements, processes, work products, and services are managed with specified delivery points. Finally, processes are reviewed and revised as needed, and they are reviewed and controlled to meet requirements, standards, and objectives. Generally, processes are not extended beyond a department or business unit, and there is often little or no executive support.
Score 26-35	LEVEL 3 - STANDARDIZE	At this level, processes are defined, understood, and documented through procedures, tools, and methods. Standards, descriptions, and tasks stem from enterprise-wide processes, and they are performed consistently across the organization while variations are allowed per established guidelines. Processes are described in more detail and more rigorously than at maturity level 2. They are managed with acknowledgement of interrelationships of the processes and measures, work products, and services. Processes are qualitatively predictable, but generally there are no measurements to enforce it.
Score 36-45	LEVEL 4 - OPTIMIZE	At maturity level 4, sub-processes contribute to overall performance, and they are controlled using statistical and other quantitative techniques. Performance measures are established for quality and performance, and they are used as criteria for managing processes throughout its entire lifecycle. Measurements are based on the needs of the customer, end users, organization, and process implementers in an effort to support future decision making. Process variations are identified and corrected, and performance is both controlled and predictable.

Score 46-50	LEVEL 5 - INNOVATE	At this highest maturity level, processes are continually improved based on quantitative measures of common causes of variation in processes. The focus is on continually improving performance through both incremental and innovative technological improvements. Quantitative process-improvement objectives are established, revised, and used to manage process improvement. Improvements are evaluated against organizational objectives, and an empowered workforce executes them. The organization rapidly responds to changes and opportunities, and it openly shares learning and knowledge. Continual improvement is part of all employees' roles.
